THE LIMITS OF PERSONAL RIGHTS IN PIANO-FORTE PERFORMANCE.

A PIANO may be made of steel, but it must not be treated unfoldment of the radical ideas. No intelligent conr as an iron steed. It is rather an Ariel, imprisoned in a box, fastened in wood, but capable of much wonderful as a right to alter is the actual text written, except in cases where there is an obvious misprint (cases, alas, by no means rare in our day of cheap reprints), or, secondly, in such instances as we frequently find in the Beethoven sonatas, where the idea runs up abruptly against a granite sody of Liszt from the powerful and impulsive Carreno wall of mechanical limitation. In illustration of the is a very different thing from the same work played by Chopin passage wherean "E" was marked flatin the right of difference are both logical and poetic, for it could not hand and natural in the left, unless the tonal connection indicated that he meant a diminished octave, I should, of ourse, reject it as a false and barbarous reading, a mere blander of the ink machine

Of the second point the illustrations are numerous in them is the present philippic directed. all Beethoven's piano-forte writings. In the "Tempest" not write these "E's," "D's" and "C" sharps was nature, since from that one peculiarity its name is derived. below. In his mind he heard the extreme tones; to-day we have an instrument that can execute them. Therefore, in playing them in the low octave, where they are spiritually indicated, rather than in the high octave, where they are actually printed, we are not violating, but do up all the grand compositions of the piano-forte liter more perfectly obeying Beethoven's directions. His the impediment has been removed? In Bulow's edition one, make a nniform practice of playing the compositions with Bulow's additional tones

In the second place, every pianist should adhere with the fidelity of bigotry to the phrasing of the music. Occasional slips and inaccuracies in the printed phrasing we may find, but wherever the idea is thus badly outlined, agglutinated to ideas distinct from it and segregated from those which are cognate, any musician with a rudimental knowledge of form and formal development will be able to supply the correction. But, fundamental as the ideas of legato and staccato are, thousands, yes, tens of thousands, of students in this country have better state of things coming about in our country, but the accents all in place.

still, pupils are not taught, from the first, to group and divide their tones into intelligible forms, as they are allel art, elecution, how meaningless and forceless would taught to punctuate the books they read.

Phrasing is musical punctuation, and Shakespeare has given us, in the prologue in the Pyramus and Thisbe episode in "Midsummer Night's Dream," a broadly ludicrous illustration of the nonsense produced by over riding commas. Such nonsense, alas, is not an absurd exception, but the rule, in the piano-forte playing we hear. It requires, no doubt, close and patient attention to fix the tones in the mind with strict reference to their groupand he would be a charlatan indeed, who never told his per cent. of all that the player has to do. pupils anything about the choice of fingers or the underlying mechanical laws which should direct their selec-

A slavish adherence to the printed text may not be always required of a great virtnoso; indeed, there are passages in the works of all great masters where the intuitions of the artist would suggest changes from the printed text; changes, however, in the direction of clearer seur would unduly criticise such modifications if they a steed. It is father and Aries, impressores in a source sound using consistent, showing a pur-lement in wood, but capable of much wonderful with the state of t and their reading of great works. Thus, the Sixth Rhapfirst point-should I find, in some slovenly reprint, a the exact and self-contained Rivé-King, but such details be said of either artist that she slights or alters the text materially. Those who justify slovenliness and absurd eccentricities on the ground of inspiration and original conception are, unfortunately, too numerous, and against his playing, will be greatly improved.

sonata there is a phrase of nnison having a form which word harp understood, is the meaning of the term. It calibre, although hardly up to the standard of a great would require it to descend to the "D" or "C" sharp would not take great acuteness on the part of a student classical player. His touch is hard and his phrasing is below the fourth space "F" in the bass staff. Now, it is to suspect, therefore, that variations of intensity are easily sharp and even harsh, but he has lots of color, and perfectly obvious here that the reason wby Beethoven did made by this instrument, and are inherent in its very that his piano stopped at "F" on the fourth ledger line It was said, with more wit than truth, that Mr. Raphael Joseffy was a piano player, but not a piano-forte player, because his pianissimo is so exquisite; the converse of this proposition would find more justification, for in all American cities are to be found pianists who regularly ature every season, and to use a metaphor of the prize piano was tongue-tied. Shall we continue to lisp after ring, they literally "knock them out of time," and not seldom badly damage their shadings, their colorings, and such filling out of the idea is very frequent, and I, for the temperament of the instrument. (Who that ever heard Rubinstein deliver the Emperor concerto of Beethoven can be unaware of the beauty in pianissimo and of the marvelous delicacy residing in this divine instrument, so often and so unjustly taxed with coldness and lack of heart.) These gentlemen are forte players, not piano-forte players. You bear such "stalwarts" defend themselves for bethumping, bethwacking, bethumming the key-board, on the ground that they dislike "tame" playing. Every tasteful connoissenr dislikes tame playing also, but tameness does not arise from pianissimo, but from indistinctness of technique, from overlapping pecked and pounded and persistently perplexed their of accents. Every musician knows that the first beat of patient pates, vainly deluded into the thought that when a measure is called the ictus, or down beat, and that it they had hit nearly all the notes in tolerable rhythm the should have a certain degree of stress, yet how seldom do task of the executant was accomplished. There is a we hear a conscientious and intelligible performance with but writes excellently (his "Gavotte Moderne" is one

To recur once more to the illustration from the parbe a reading of poetry, or any piece of resonant prose, where the accents were feeble.

In conclusion, then, let it be said that a pianist who does conscientiously the things prescribed for him, npon the dead page, cannot wander far from the domain of high, interpretive art. He has accomplished ninety-nine hundredths of his task, and that last grain of personality which he owes us, though it be precious as the mnsk which, mixed with the mortar, forever perfumes the air ing, but this is fully as important as correct fingering, of the mosque in Constantinople, is, nevertheless, but one

JOHN S. VAN CLEVE.

### SOME PIANISTS IN AMERICA.

TT

Mr. E. B. Perry, of Boston, despite his blindness, plays the piano beantifully.

Earnest Perabo is a good Beethoven player; while John Preston and G. H. Tucker are both making rapid

Mr. George Nowell, a talented pupil of Leschetitski, made quite a hit in his native town, Boston, by his excellent rendering of Weber's Concertstück. He is a prom-

Mr. Milo Benedict is a player of the romantic school, and, while lacking a certain vigor, is, withal, a charming player, who, if he only persists in his studies, will be eard of sooner or later.

Mr. Alexander Lambert is a very popular pianist, who has toned down a somewhat exuberant style, so that everything that comes from his fingers is in a good style. He has repose, which, for so young a man, is commendable, and when he overcomes a certain angularity in

Mr. Frederic Boscovitz, a cousin of Joseffy's and a The name piano-forte is significant; soft-lond with the comet in the pianistic world, is a pianist of no mean technic galore.

Mr. Angust Spannth is a muscular artist, who believes in music militant, and, like the famons John Pattison, Oscar Newell, et. al, goes for the keyboard. It should be called the Dynamite School.

John Orth and Otto Bendix are two players of respectable ability, the latter possessing a poetic style and a decided taste for Northern music.

Mr. W. C. Seeboeck, of Chicago, is one of those artists of whom one cannot predicate anything definite. He has a gennine gift of music both in composition and performance, but here, again, the nucertainty of his musical temperament comes to the foreground and renders his really fine talents almost null.

Dr. Gustav Satter, the "Mephistopheles of the Piano," is another glaring example of a great talent gone to seed for want of ballast. He bad an enormons technic and simply one of the finest touches conceivable, but then his performances at times were simply outrageons, and, like his compositions, have drifted into oblivion

Constantin Sternberg is not a great pianist. touch is hard and his handling of the instrument clnmsy, but he contrives to impress one with the idea of his with the pedal, and above all from the universal disregard thorough musicianship. His friend, Mr. F. W. Riesberg, a pupil of Liszt, has lots of dash and brilliancy at the piano, but is as yet a callow virtuoso.

of the best of its kind published). His repertory is

The reception tendered by the Utopian Club to the celebrated musician, Karl Klindworth, was one of the most enjoyable that this musical club has ever given. There was a large attendance of both professional and annature musicians. Dr. Klindworth is well known to all musicians through his musterly edition of Chopits piano-forte works. In Europe, his fame as an orchest rac conductor is widely spread. The musical part of the evening's entertainment was in the capable hands of Messrs Jarris, Hennig and Van Gelder, all of whom played as though they felt that the fair fame of Philadelphi's amusicians was at stakes in the arrestness of the Musica Tandhard. be promoted.

I remain, sir, yours very truly,

Question. Why should a child study music?

Answer. To support the teacher.

Q. What sort of a teacher deserves hest to he recommended?

G. What instruction book should the pupil use?

J. Why, the one she has, of course. That saves her
he expense of huying a new one.

Q. What is the use of an instruction book?

J. To show the teacher how to teach.

G. How is the child to use its hands?

J. Let her wave them gracefully; that pleases the

state and exercises?

8 to J. Wy, he should not hother the child with them.

Q. Should the teacher read musical journals?

Q. Should the teacher read musical journals?

A child the state of the state

Mr. Famy Raymond-Ritter, who is, perhaps, bast known as a writerly byte fine translation of Schumatics. "We will be a seed to the policy of the policy in these poems an ancommon originality of the policy in these poems an ancommon originality of the policy of the poli

[For THE ETUDE.] TARANTELLE.

Hark! hark! Hark I what a tramping of feet And what shouting! See down in the valley the villagers dancing.

They hop and they skip, and they spin and they spring Both old ones and young ones are merrily prancing; Both old ones and young ones are merrup francing; Naught equals their steps' irresistible swing. The handsome, the ugly, the lithe, and the heavy, The tall and the small, and the stout and the lank, All join in a noisy and froliesome bevy, With ne'er a distinction of age or of rank, See how the sweet maidens their ribhons are tossing, And round after round will unloosen their hair, Now glide they about, now straight through are the

crossing; Their mirth and their laughter ring high in the air. Their mitta and their languater ring night in the sur-The boys, gas plut assivant, are clumsily thumping Their heels, at each step coming down with a thud; Now running o'er one, against another one bumping, Now sweeping them all with the might of a flood. How brimful of life is the sound of their voices! How hold and defiant the look of their eyes! Yet tender their smiles to the maids of their choices, Yet loving the song they fling up to the skies. But now see, when none are watching, Two by two they steal away; Strange to say, the fever's catching; More are going, where, I pray?
This the hour when daylight's fading,
When young heads are full of love;
Tender feelings are pervading.
Hearts below and stars above.
Two by two rather flee

From the spies' searching glance, Rather love and be free Than to dance.

Lo! Lo! Lol Lol
Lol what a change in the play,
And what silence!
Of elfins the wings are mysteriously filting,
And noiseless encircle the scene of the dance;
Their motions they seem to a tune to be fitting,
And trance born, themselves to sucquain to the trance. ee them imitating the swaying of maidens, Their skipping about and their tossing of hair; You'd wager the ghost of a musical cadence
Alone for the elfins vibrates in the air;
And among them some seem to be wildly hounding, Behaving themselves just like clumsy young men; Reality thus with sheer vision confounding, They give us a show which no language can pen.

Darker and darker the night's quickly growing, Elfins and spirits are now indistinct; Only dark waves through the night are felt flowing, Only dark waves through the night are left Howin Strangely to rhythm and to cadence yet link'd. But now say, tell me, pray, What is the name of this play? For children of Italy nothing can equal The boisterous inn of their national dance; Its frenzy, its madness, its amorous sequel,
Of life, the short pleasures for them do enhance,
They will spring on, they will swing on,

As if moved hy magic spell:
They will dance on, they will prance on,
With might and main, At thy sweet strain, O Tarantelle l

### AN OPEN LETTER TO J. C. FILLMORE.

CINCINNATTI Ohio, January 5th, 1888. MY DEAR FILLMORE: It is not needed by so long-tried and esteemed a friend as you, that I shall preface this remonstrance with laudatory words or honey coat dis-

scale was originated, you say that this lead to the melodic scale, yet you had just outlined the harmonic minor scale and no other. Finally, you say, "The time will come when the minor scale will be as dead as the mediaval

and no other. Finally, you say, "The time will come when the minor scale will be as dead as the mediawal modes." And these first propositions, some of them are, doubted the search of t

ing it downward, not a hint of which is eisewhere rouse, and, last of all, using for the Doric the precise letters and intervals employed for the Phrygian. As to reading the scales downward, as well as upward, I heartily approve of the property of the pr scaled downward, as well as upward, I heartily approve of
that idea, and I have hean executomed for years, both in
my own masical thinking and in my teaching, to require
an equal amount of reading downward both in chords and
scaled by the state of the incident our tone theorists are singularly pronte to forget that in the language of tones, as in the language of tones, as in the language of owneds, unage is the Czar, and that such at thing as a complete graduated pocket ring, fitted to the exact measurement of every delicacy, does not exist. After all, the Monterverds, has become an inherent law of the music of the last two hundred years, insomuch that there is to our cars no otherency or completeness at all without lit, is that it agands well. Mendelssohn, who was the set of the second of

harmonic musting the which acked the considered as a generator of melody, representation of the mental properties of the considered as a generator of melody, or in the same minor scale as a generator of harmony. Why for instance, should not the minor key have the same minor scale as a generator of harmony. Why for instance, should not the minor key have the two dominant harmonics, with the considered as the state of the considered as the co

and estemest a friend as you, that I shall preface this sent with commendation, but one thing I must say, by any of corner-stone agon which to event up opinions, and the control of the c

### THE STUDY OF THE PIANO. STUDENT'S MANUAL.

PRACTICAL COUNSELS.

BY H. PARENT.

(Translated from the French by M. A. Bierstadt.)

### THE NECESSITY OF COUNTING. 36. In what cases are the five fingers used

without displacement of the hand? The five fingers are used without displace-

ment of the hand when the number of notes following one another in ascending or desceuding does not exceed the number of fingers.

In this case, if the notes succeed one another in regular degrees the fingers do the same. Example:-

If the notes succeed one another in irregular degrees, as many fingers should be passed over as decrees.

Example:-Aample:-- 1 7 5 2 1 If the hand without being displaced has to

reach over an interval exceeding a fifth, the rule for fingering by extension of the fingers must be followed (see No. 38). Example:-

It is important to notice at the start a point concerning the formation of the hand: that the two thumbs, finding place within the various a fourth; and the second and fifth more than a combinations of fingering, are found to be in- sixth. verted in the two hands; that is to say, a succession of fingers used in an ascending passage in the left hand (in the direction of the fifth verted in the two hands; that is to say, a sucfinger to the thumb) would be found reproduced in the same passage descending in the right the thumb)

Example :--37. What is the displacement of the hand by drawing together the fingers, and in what

cases is such fingering made use of? Displacement of the hand by the elision of one or more flugers is the drawing together of the fingers in such a way that there are more free fingers than there are notes to be bridged

Example :-

cal ascending or descending passages or forms in which there are neither digressions nor notes repeated and which comprise no more than five

Note,-Whenever a certain form is reproduced regularly, it is better that the same fingering be used each time (if the disposition of the black and white keys will permit). Symmetry in fingering where there is symmetry in passages greatly facilitates execution.

The conjunction of fingers which is most in use and best is that of the thumb and any other finger of the hand.

as possible to the thumb in going down the key the hand gains its equilibrium.

board with the right hand and up with the left, and the thumb as near the fifth finger as possible in contrary cases.

38. What is understood by displacement of the hand by extension of the fingers, and in what cases is this fingering employed?

To displace the hand by extension of the fingers, is to stretch the fingers apart in such a way as to bridge over more keys thau one has fingers.

This mode of fingering is used in ascending or descending forms or passages in which the notes succeed one another in irregular intervals, and in which the whole comprises more than the interval of a fifth.

Sometimes in the same form both extension and elision of the fingers have to be employed. Example:-

second finger allows of taking a fourth or fifth,

but it is not necessary to go beyond this. The thumb and third finger should not reach beyond a sixth. The thumb and fourth finger must not reach beyond the seventh.

The second and third fingers must not take more than a third : the second and fourth more than

The third and fourth fingers must not take hand (in the same direction of the fifth finger to more than a third (even this stretch ought to be avoided if possible). The third and fifth should not take more than a fourth.

The fourth and fifth fingers should not stretch more than a third. Example:-

The extension oftenest used and best is that between the thumb and any other finger of the In this case one or more fingers are juactive. hand; others between the three middle fingers are not as good.

39. What is understood by the displacement of the hand by the passing of the thumb under the fingers, or the fingers over the thumb? and in what cases is this fingering used?

To displace the hand by the crossing of the thumb is to supply the deficiency in the number of fingers, by passing the thumb under the fingers in going up in the right hand and in descending in the left, or the fingers over the thumb in descending with the right hand and ascending with the left.

The thumb should be regarded as a point of support, around which the other fingers act, and for this reason it is preferable to pass it the finger of the hand.

The fifth finger here is to be brought as near the latter over the thumb. By this combination

The hand is displaced by the crossing of the thumb in every passage or phrase containing more than five consecutive notes. In symmetrical forms of regular movement, the fingering should be so arranged that the thumb has to cross only as many times as is necessary for the number of notes given, especially when the passage is composed entirely of white

In phrases or passages where there is a combination of white and black notes, when the notes succeed one another by regular degrees or by irregular degrees, the rule is the same: the thumb must be put under after a black note in scending with the right hand.

6 .... And in descending with the left hand. Example:-

0 , 5 , , , , , , This rule has for a basis the formation of the

hand in its relation to the notes on the keyboard. The thumb being shorter than the other fingers, and the black keys more elevated the fingers, and the black keys more elevated than the white, the thumb glides along more easily when the finger under which it passes is placed on a black key; it has less distance to go.

The diatonic scales, which begin and end on the tonic, are the most symmetrical of all passages in joint movement, and the arpeggios (the perfect chords, dominant seventh, or diminished seventh) are the most symmetrical of all forms in irregular movement; the student would do well, then, to analyze the fingering in these, having in special view the passage of the thumb. This fingering is, save a few exceptions, founded on the preceding rules.

40. What is meant by the displacement of the hand by change of finger on the same note repeated twice, and in what cases is such fingering made use of?

Displacing the hand by change of finger on the same note is using successively two different fingers on this note for the purpose of placing the hand in a favorable position for what fol-

In passages called repeated notes, the choice

of finger placed on the second note must be goverued by the number of notes given.

Example:

If the repeated notes are slow and belong to melodic passage, they can be struck with the same finger; for then the tones obtained will be more of like quality.

### SOMETHING ABOUT BEGINNERS.

Mr. Bowman remarked in Indianapolis, that 95 per cent of the elementary piano study, that is theing tearried on in this country, was worse than

The reason for this is near at hand. Every time we meet a visitor in the place where we live, the first thing he will speak about is the musicians living in his place of residence. The conversation is nearly always the same. He says: We have some very fine musicians at home; there is Mr. A. Mrs. B and Miss C. Mr. A is a very fine performer, but he is not so well liked as a teacher, somehow he don't seem to be able to impart his knowledge to his pupils. Mrs. B will take only advanced pupils, etc. The fact is, simply that teaching beginners is, with the exception of a few particularly gifted children, a very tedious and trying occupation; and, as patience is a very rare thing am ong musicians, they avoid it whenever they can. The consequence is, that those that could do it, won't do it, and those that would do it, can't do it

I have been compelled by circumstances to tesch beginners for the last seventeeu yesrs, but although I have made my work ten times easier than it was ten years ago, I would discontinue it to-day if I could, and would rather teach pupils who have had even poor instruction for two or three years than beginners; this is much easier work, and not nearly so trying.

Of all good musiciaus, 20 per cent. only will accept beginners of average ability, and of this 20 per cent., only 25 per cent. will really take the time to study them, and adapt the material for instruction to their wants; the rest do the work only because they are obliged to make a living, and take some instruction book to go from page to page, never troubling themselves whether it suits the pupil or not. Thus 95 per cent. of the teaching done is worthless

To teach a beginner, and to teach a pupil that has been taught for some time already, are two entirely different things, and it takes a great deal more experience and judgment to teach young beginners than to teach more advanced pupils, no matter how poorly they may have been taught. Our different systems for beginners are nearly all written by fine musicians, living in large cities, who teach, almost exclusively, advanced pupils. Constantly they receive pupils from all over the country, who are more or less deficiently taught, and it is very natural that some of them conceive the idea of writing a course, that might help the teachers of lower grades to turn out

In order to read well and readily, it is necessary to have a practical keyboard of harmony. I mean by this, a thorough knowledge of the construction of the scales, chords, connection of the keys and their location on the clavier. This can, as far as beginners are concerned, never be done by memorizing or or writing exercises, in short, by studying theory. On the contrary, in order to be able to study theory successfully, it is necessary to have a practical and positive knowledge of the material used for the study of theory. The only effective and at the same time the easiest way to acquire such a knowledge, is daily exercises. Transposition, by a given modulation does not answer the purpose. This presupposes already some knowledge of harmony, and is soon remembered and done mechanically. It must be done from the key of C directly into any other by the corresponding numbers of the different intervals

The exercises for beginners thus far published, are too long in form, and not compactly enough compiled to form a course by which the pupil can practice all the different movements of the fingers, wrists and arms daily, and at the same time have the entire family of keys constantly under observation.

The average beginner cannot be expected to practice more than a halfhour a day. If you force him to do more, he will only learn to hate his music and just " sit off" his time with the same feeling as a convict, not to speak of the numberless difficulties and unpleasant occurrences that will arise from ill feeling created between the teacher and pupil, even when the parents co-operate with the former. Of the half-hour, fifteen minutes are to be given to exercises, and fifteen minutes to pieces. Later, the time for exercise can be reduced to ten and that for pieces increased to twenty minutes. From ten to fifteen minutes for exercises is sufficient for from two to three years but the time for pieces must be increased, as soon as the pupil has on hand ample material to prevent a too frequent repetition of the same pieces. With the exception of the first few months, there is no need of purely mechanical exer-From that time, the mechanical practice be combined with mental work by transposition. Purely mechanical exercises can be done more effectively away from the piano, than at the piano, either by lighter gymnastic exercises. But for beginners it is hardly necessary, because while they acquire sufficent independence of the hands, and practical knowledge of the clavier and reading, they have time enough to cultivate the necessary technic in an easy and natural way. When a beginner has a collection of daily exercises, comprising all the different technical difficulties, and compiled in such a way that he can play them in a different key every day, within from ten to fifteen minutes, according to the difficulty of the different keys, there is no need of any such wordy and musically meaningless so called studies as those by Lebert, Köhler & Co. There are as many pieces and studies, that contain just as good

exercises in a good musical form, and there is no necessity at all, to use anything that does not represent adequate musical value, and cannot be used practically for performances in social life.

There is, however one point that must not be forgotten, and this is the difference between mechanical work and brain work. Some medical authority has stated that two hours of concentrated brain work, is equal to a day's work of hard labor. One can set at the piano for many hours playing mechanical exercises and studies by Czerny, Köhler, etc., but let him transpose these same studies into different keys, or play music at sight; that requires close mental attention, and he will find very soon how his powers will wear out under the mental strain put upon them, Therefore, when we feed a pupil with work that requires constant mental attention, we have to limit the practice time accordingly.

### PIANO POUNDING.

BY OLIVER WENDELL HOLMES

I don't like your chopped music, any way!

That woman-she had more sense in her little finger, than forty musical societies-Florence Nightingale, says that the music you pour out is good for sick folks, but the music you bound out isn't.

Not that, exactly, but something like it.

I have been to hear some music pounding-

It was a young woman, with as many white muslin flounces round her as he planet Saturn has rings, that did it.

She gave the music-stool a twirl or two, and fluffed down on it like a whirl of soap-suds in a hand-basin.

Then she pulled up her cuffs as if she was going to fight for the champ-

Then she worked her wrists and her hands-to limber 'em, I suppose, and spread out her fingers till they looked as though they would pretty much cover the keys, from the growling end to the squeaky one,

Then these two bands of her's made a jump at the keys as if they were a ouple of tigers coming down on a flock of black and white sheep, and the piano gave a great howl as if its tail had been trod on.

Dead stop-so still you could hear your hair growing.

Then another jump and another howl, as if the piano had two tails and you had trod on both of them at once, and then a grand scramble, and string of jumps, up and down, back and forward, one hand over the other, like a stampede of rats and mice more than like anything I call music.

I like to hear a woman sing, and I like to hear a fiddle sing, but these noises they hammer out of their wood and ivory anvils-don't talk to me,

I know the difference between a bullfrog and a thrush.

# ----"PIANO-FORTE MUSIC."

When the author of this book first sent it into the world, about four years ago, he felt the anxiety natural to every one who, publishing his first book, awaits the judgment of those whose opinious he respects, and whose decisions must make or mar the fortunes of his work. But these apprehensions were speedily dispelled by the extremely favorable reception accorded to the work by musicians and critics. The errors pointed out were few and slight, the differences of opinions were, for the most part, unimportant; in short, the labor and care expended on it were so fully acknowledged, and so generously approved, that it would be exceedingly ungrateful on the part of the author not to take the present opportunity to express his sense of the courtesy and appreciation given him by the musical public, and especially by that portion of it which represents its highest intelligence. Such appreciation is at once a profound source of gratification and an incitement to renewed striving after

The present edition, demanded by the requirements of the market, has received no revision, partly because in the main parts of the book the author believes he has done his best, and partly because the time has not come for revising the chapter on "Modern Composers and Virtuosi of the Present," although such a chapter must necessarily be incomplete.

With gratitude for the past, and with hope for the future, this third edition is offered to the public.

MILWAUKEE, WIS., Nov. 21st, 1887.

## SCHOPENHAUER'S MUSICAL PHILOSOPHY.

READ BEFORE MUSIC TEACHERS' NATIONAL ASSOCIATION BY KARL MERZ.

Having reviewed in the last lecture the musical theories of Herbert Spencer, Prof. Helmholtz, Mazzini and others, I will now lay before you the substance of Schopenhauer's Philosophy of Music.

Germany is pre-eminently the land of music, and in a like sense it is also the land of metaphysics. Strange to say, among the many philosophers that Germany has produced, only few have dealt successfully with the subject of music. Even Kant, the founder of an art-philosophy, regarded music merely as a pleasant play of the emotions; but says Hand, "He failed to make out whether a mere sensuous impression or the effect of a discernment of form prevailed in that play." Kant denied what every student of art now acknowledges, namely, that music is a language of the emotions, and a means of awakening esthetical idess. According to Richard Wagner, only one philosopher has fully understood and correctly set forth the high position of this art. In his little book entitled "Beethoven," he says: "Schopenhauer was the first to recognize and designate with philosophical clearness the position of music with reference to the other fine arts, in that he awards to it a nature entirely different from that of the plastic or poetic arts." This decided testimony in favor of Schopenhauer's musical philosophy is all-the stronger in view of the fact that Schopenhauer was by no means a follower of Wagner. Yet, at first sight, it would seem as if the two men were musical antipodes; for Schopenhauer speaks favorably of Rossini's music, which in its character, its construction and tendency, is as far from Wagner's ideas of musical art ss the east is from the west.

Music cannot be made the medium of a special theology or of a code of ethics; we as musical students, have therefore nothing directly to do with Schopenhauer's peculiar theories. Still as his philosophy of music is closely connected with his theory of the will, we must make you acquainted with it-

When reviewing this philosopher's theories, we must indue of him in the light of bis own times and surroundings. The convulsion in society produced by the French Revolution, and the bitter Napoleonic wars which followed. could not fail to make its impression upon such a mind as that of Schopenhauer. Religious skepticism prevailed everywhere among the learned as well as among the masses. True religion was scarcely found anywhere. After the years of warfare had at last ended, the masses gave themselves over to pleasure seeking. The various governments of Europe did all they could to turn the people's attention from the affairs of state and public morslity. Every conceivable amusement was provided for the masses, and it was at that time that Rossini, with his sensuous operas, prevailed everywhere, over-shadowing even a man so great as Beethoven, and that in the very city of Vienna, where Beethoven dwelled almost as an exile. It was at this time that Strauss and Lanner, the dance-kings, appeared on the arena, furnishing their charming new dances for ball-rooms,

While thus the people were made drunk with pleasures the affairs of state being in the hands of reactionists of the worst kind, all thinking men cherished secret sorrow at the existing state of things. But what they cherished as their own grief, was the common grief of the best men of the nation everywhere. It was produced by that political and moral mildew which was setting upon the minds of the people, and this grief is called in German, the Weltschmerz, or the grief of the world.

Beethoven gives expression to the "weltschmerz" in many of his matchless works, but Schopenhauer is the true representative of this idea, and he carried his state of dissatisfaction to such a degree that he became a pessimist of the very first water. There runs throughout his writings a vein of despair that shocks one, and the reader is often chilled, and even frightened at the terrible coldness with which he destroys and dispels all those fond illusions and pictures of fancy to which the human mind often resorts and clings as a relief. As Schopenhaner took a deep interest in sacred Hindoo literature, one meets quite frequently in his writings a peculiar Oriental cast, a sort of Buddistic spirit, which here and there lends a peculiar coloring to his essays. Then the attentive reader cannot fail to discover, also, Schopenhauer's peculiar views about women, which causes one almost to believe, that Schopenhauer lived a few centuries ago. But enough of these preliminary

Schopenhauer was born in Dantzig, Germany, in the year 1788. His father was a rich merchant; his mother was the well-known authoress of novels, Johanna Schopenhauer. A literary vein seems to have run in the larger portion of the Schopenhauer family, for the daughter, Schopenhauer's only sister Adele also was a novelist. When Dantzig was ceded to Prussia in 1793, the family being anti-Prussian in political sentiment, moved, at considerable loss of property, to Hamburg. The elder Schopenhauer was a very intelligent man. He was fond of reading, but still more so of traveling, and he made frequent and prolonged visits to England and France. These visits to foreign countries made young Schopenhauer a good linguist, for he spoke and wrote both English and French, quite fluently. He was also well versed in the ancient languages, both Latin and Greek, and wrote dissertations in the former language. While the father had many excellent points of character,

he had also some great weaknesses, and these the son not only inherited, but they became intensified in him. One of these failings was a decided morbidness of temperament, which sometimes seemed to overwhelm him. His mother evidently had no special affection for her husband, and sought pleasure in society and travel, which separated her much from her family. Young Schopenhauer, being the only son, was designed by his father for the countinghouse; but, do what his father could, his son rebelled against all mercantile employment. Mild forms of correction were employed, but these were of no avail, and at last the choice was left him between a regular college education and a visit through Europe. Although young Schopenhauer was eager to learn, he choose the latter, and in 1803 the family started for England and Scotland, where they remained for a considerable time. During this period our young philosopher was put into a boarding-school at Wimbledon, near London. and it was here that he acquired a thorough knowledge of English which he often displays in his writing. But what is far worse and much to be deplored, is the fact that in this boarding-honse he took a cordial dislike to English formality, and especially to the English clergy and English ideas of religion. He is most unsparing when the opportunity offers itself to speak of the clergy of the Church of England, and he himself says that a great deal of that bitterness which he feels toward religion in general and the ministry in particular is chargeable to the clergyman, who presided over the Wimbledon

After leaving England, the family visited Switzerland and then returned home. But scarcely had they been settled again in the old home, when the father died. Prompted by a sense of reverence for his parent's wishes, the son now entered the counting-house; but the desire for higher knowledge at last became irresistible, and prompted by his thirst for learning, he finally entered the University of Gottingen, where he studied history and natural sciences, two studies, he says, which in his latter work proved very helpful to him. Here he became acquainted with Schultze, who aided him with his sound advice. When referring to his metaphysical studies, Schnltze counseled Schopenhauer to read Kant and Plato first and cautioned him under no circumstances to read any other philosopher, especially not Aristotle and Spinoza, until he had thoroughly digested the first two named authors. In 1811 he went to Berlin, drawn thither by Fichte, but after hearing a few lectures from this philosopher, he felt disappointed and turned from him. In 1813 he endeavored to secure the Doctor's degree at the University in Berlin, but the war with France being then at its height he was prevented from making the attempt. He finally, however, took the degree at Jena, and then turned towards Weimar, the literary Mecca of Germany, where he was favored with Goethe's friendship. It was here, also, that he met the oriental scholar Meyer, who caused Schopenhauer to interest himself in the holy writings of East India, which, as has already been stated, gives some of his essays such a strange cast. During the period from 1814-18 he lived quietly in Dresden, and while there he wrote his famous treatise on 'Sight and Colors." About this time he also wrote his most famous work, "The World as the Will and its Representation." In 1818 he visited Rome, and then returned to Berlin. where he connected himself with the University as a lecturer. But he was soon drawn a second time to Italy, where he remained until 1825. He again settled in the Prussian capital, but the approach of the cholera drove him a second time from that city, and this caused him to finally settle in Frankfort on the Main, where he spent his life. He was fortunately situated, for his father had left him ample means. He was therefore not compelled to labor for his support; he had command of his own time, was independent of the powers that ruled, and could afford to say exactly what he thought and felt. He was never slow to express his opinion, and did so regardless of people or

He now gave himself exclusively to metaphysical studies, and wrote diligently. His first work, "The World as the Will and Representation," failed to be recognized, and was left totally nnnoticed, and this was to him a source of great mortification. Not until 1836, when he published a little pamphlet, entitled The Will in Nature, in which he set forth his philosophy in the most concise form, di his writings attract any attention whatsoever. In 1839 one of his theses was crowned by the Norwegian Academy of Science. In 1851 he wrote his best work, entitled "Parerga and Para-li-pomena," a series of short essays on metaphysical subjects, which are very fine specimens of

Schopenhauer lived for thirty years in Frankfort, and was known there as the Misanthropic Sage. On lonely walks he was always accompanied by his poodle, to which he was much attached. In fact, it is said of him that he spent more time in the company of his dog than in that of man. It is the inion of those who lived nearest to our philosopher that his sad experiences in his dealings with men, and his antipathy to his mother, made him the pessimist he was, but that at heart he was kind, especially so towards the suffering. He felt much sympathy for those who had to hattle with the adversities of life, and in his philosophy he advises us not to become angry at the meanness of men, but rather to pity them on this account, and to regard them as fellow-sufferers. Says he: "When you meet a human being, try not at once to settle his mental and moral value, nor endeavor to fix his inherent degree of dignity, neither attempt to fathom his mind or to settle the absurdities of many of his views. The first would lead to hatred, the second to contempt; but rather regard your neighbor from the standpoint of snffering; see him in his perplexing anxieties, in his vain strivings, in his unsuccessfu endeavors to secure peace and quiet, in his needs and wants, in his ailings of body and mind, and you will be forced to regard him as your kinsman. Instead of indulging in hatred and feelings of contempt, you will then arouse sympathy, that sympathy which is love, and (says this pessimistic Schopenhauer, who is regarded as totally devoid of all regard for religion,) it is this love which the Gospel teaches." As far then as this basis is concerned he stands on religious ground. But let us follow him a few steps farther. Says he, "if you have cast a glance at the meanness of man, and are ready to hecome exasperated over it, endeavor to awaken sentiments of sympathy hy looking at the sufferings you see everywhere among the children of men. And if this again alarms you, turn your eye upon the corruption of human nature, and thus will you establish a healthy equilibrium in your mind. Then will you learn that there is eternal justice and that this world is judgment." Schopenhaner is a firm believer in the doctrine of total depravity in man, even in infants. He recognizes the need of a change of heart. But in the use of means we differ with him, as we shall presently see.

Schopenhauer turned away from all society, from all those active participations in those aspirations which agitate the human family, but for all he was a diligent reader of the European press; yes, he often took its statements to illustrate and prove his teachings. That he and his mother could not agree is a sad fact, yet there were good causes for it. She saw the world only from the standpoint of enjoyment, while he was a deep thinker, a philosopher, who saw the world only in the light of suffering. He believed in Aristotle's idea, that the avoidance of trouble, which he calls a negative sort of happiness, is far more desirable than all the pleasures which society offers. He was a profound scholar, a misanthrope, a pessimist, while his mother was one of the worst optimists. In one of her letters she said to him, "your lamentations over this stupid world and the misery of mankind give me bad nights and evil dreams." Another reason why Schopenhauer felt bitterly towards his mother was her neglect of his father's memory. There was a great gulf, so to speak, between the two, and so mother and son went their own ways. They had apparently nothing in common but their names. If I should be forced to take sides between the two, I would stand with Schopenhauer, for his ideas of the human family in all its corruptness, his ideas of the evil propensities of human nature, correspond most nearly with

But let us drop the curtain upon this sad picture. I merely raised it in order to show you that the strongest men find it often impossible, by their own strength, to swim against the current of circumstances. Philosophy always has had a clear perception of the disturbed condition in the human heart, but philosophy never found the true remedy. This the Gospel alone supplies. Schopenhauer was well read in ancient as well as in modern literature. His best ideas, he says, came from Kant, Plato and the sacred writings of East India. He always was serious; he could not bear to see anything abused, neither man nor beast, literature nor art, religion nor philosophy. He hated all cliques, all unmanly means to oppose those that think differently; he despised the socialistic ideas of modern times, as these developed themselves during the revolutionary days of '48 and '49; in short, he was completely at onts with his own times, and with many of the men that held the wheels of government or that fashioned public thought. Despite his exclusiveness, many great men came to Frankfort to make his acquaintance, and not a few remained with him in order to study his philosophy or to listen to his interesting conversations. This made the last years of his life more pleasant and himself more social. By nature he was an aristocrat; in his teachings and conversations he was an autocrat. He denounced many of those who taught philosophy in the Universities of Germany as mere Sophists, and, upon the whole, he called them a most sorrowful crew. Hegel he regarded as the arch-humbug. Even Kant he accuses of veiling his ignorance at times by using language that is difficult to understand. Yet it must be said of him that he held Kant in the very highest esteem, and he often pronounced him the clearest thinker of modern times. Schopenhauer despised obscurity in anything, so he was also a despiser of all duplicity in the use of language. When he speaks, he always aims at a point; he never sets off mere fire-crackers or Roman candles. He always uses hard shot that hits, though from a Christian standpoint he often shoots at a wrong target. If he uses the knife, he cuts to the bone, and what he says he ntters regardless of the opinions of others. He displays the atmost faith in the correctness of his own theories, and predicts that in the future, when men shall judge with more freedom, this philosophy will be accepted as the only correct one. What if such a man had been a Christian, a teacher of sound theology. His writings are sometimes difficult to understand, partly because he uses technical terms with special meanings attached to them that must be learned by much close reading of his theories Moreover be often writes in lengthy and intricate sentences, but after studying these, his ideas always stand out clearly. No matter how we may dislike many of these id-as, and no matter how much we may deplore the fact that they were not turned into the right channel, we must give him credit for fearlessness, for candor, and for freedom from all school-caut. The fundamental ideas of his philosophy are these:-The Will of man is the real thing in this world, all else is mere representation. This Will, of which Schopenhauer

speaks, is not what in common language is meant by the absolute free power of action, but implies, in the philosopher's mind, the essence of all things, the all-pervading power manifesting itself everywhere. This Will stands separate from the faculty of reasoning; it is the thing in itself in which the created world and the Creator meet. From this standpoint man becomes the act, the true manifestation of the Will. The Will, which lies at the foundation of all representations and appearances, develops into a succession of ideas. From the animal downward, the Will is void of cognition and ideas; it is a mere hlind force, an unconscious seeking and fleeing. It is active in plant life, in animal life, until in man it manifests itself through the nerve power and the hrain, thereby reaching its highest state of self-consciousness. The Will comes first; it is the greatest factor, and the Intellect stands second to it. According to Schopenhauer's theories, the Intellect is a tool in the hands of the Will, if I may be permitted to use this expression. The Will always manifests itself through motives. In the animal the Intellect is snbordinate to the Will. The animal knows and follows only the laws of self-preservation. Prompted by instinct it seeks food and shelter. Among the common people, that factory ware of society, as Schopenhauer calls them, the Will has no higher aims and wants than self-gratification. With them the Will is the master and the brain the servant, but when the man becomes educated, when he reaches a high state of culture, the brain begins to rule and gradually subdues the Will. In genius, which is the highest type of sensibility and intellectuality, the mind becomes the supreme ruler. The Intellect is so completely absorbed and so intensely interested in the clear perception of things, that the Will is, as it were, put into chains; the mind emancipates itself from the Will and its powers, and it is then, and not until then, that the mind learns to see things in their true light; that is, the mind sees things no longer in the light of mere usefulness and productivity, hut simply for their own sakes. This is the pleasurable asthetic contemplation of which Schopenhauer speaks so mnch, and of which I will say more at another place. This æsthetic contemplation affords us, however, only temporary relief; it suppresses the Will power only for a brief period of time, for the renewed activity of the Will forces upon us new wants, and thus prevents us from enjoying permanent rest The Will desires to have and to live, but, as life is inseparably connected with suffering, the Will, if gratified, must necessarily lead to suffering. The more the Will is supppressed, the more effectually it is denied, the better and purer man becomes, until finally, in sanctification, by turning from life, he realizes in himself a complete deathness towards this world, and a cheerful resignation to its conditions, which gives him the much sought for relief. Thus we see how our philosopher seeks through self-abnegation that which, according to the teachings of the Bihle, can only he found in a cheerful resignation to the Will of God, and in accepting the plan of salvation. But, continues the philosopher, that which appears only in single instances among the pure, the good and the sanctified, -that is, the perfect denial of the Will, -would, if it were reached by all, lead to the destruction of mankind; as we now know it, it would be the end of that world which represents the Will. For this new order of things, however, we lack all conception, says our anthor, and to use it is therefore equal to nothing. On the other hand, we must bear in mind the fact that our world is nothing in the eyes of those who have denied the Will, and who have come to realize its tendency.

At one time Schopenhauer's philosophical theories seemed to reach the masses of Germany, but they have lost much of this popularity. In the land of Locke and Bacon he became known in 1858 through an article in the Westminster Review, and it is claimed that the attention which was hestowed noon him by the English press tended largely to make him known among his own

Schopenhauer died in Frankfort on the 21st of September, 1860, at the age of 72. His house-keeper found him one morning, after breakfast, difeless in his chair. He left a portion of his estate to the Invalides of the Prussian army who fought against the Socialists and Liberals in the revolution of '48 and '49. He allowed nothing to be put upon his tombstone but the hare name,

Perhans some may think that, insamuch as we are only concerned in Schopenhauer's musical theories, I have paid too much attention to his life and philosophy; but you will presently see that, in order to understand this latter, the facts given you are as a hasis. His life-story might have been omitted, but I know that there are many among you who would be interested in it. So let us now retrace our steps in order that we may properly get a clear understanding of the real subject in hand.

Kant, in his "Critique of Pure Reason," says that he has proved the abso-Inte impenetrability of the essence of things by human knowledge. In order to see objects we can only behold them in time, in space and in their mutual relations to cause and effect. We can therefore not go beyond the appearance of things, and there must always be something unknown, namely, that which exists independent of the appearance, independent of time, space and causality. This Kant calls the "thing in itself," and as we cannot grasp it, this thing in itself is called the X of the universe. Schopenhauer steps in and says, that the Will is that which represents this X, and he claims that, hy this solution, he has given positiveness and consciousness to the metaphysical world. The Will pervades all things, hence we become identified with all things, and (To be continued)

### CONCERNING THE PSYCHOLOGICAL RELATION OF MUSIC.

### By W. S. B. MATHEWS.

The various operations of cognizing music may be reduced to three categories: perceiving, comparing, and concluding. For example, certain sounds fall upon the ear, where they make impressions of number and intensity. The investigations of Helmholtz have shown the mechanism by which the ear takes cognizance of impressions of pitch and power. We may suppose that this part of the work is done automatically, just as in the harmonic telephone the receiving forks answer to their own rate of vibrations, only. So the little filaments spread out in the cochlea of the ear probably answer to specific rates of vibration, or nearly so. Upon whatever filament a series of vibrations falls, the report of it is immediately sent upward to the brain, to what is called the cortex, or outer coating of it, and to the particular part of this having to do with musical sounds, or, more properly, impressions of pitch. Now the cortex of the brain is one of the most curious structures known to Anatomy. It is of considerable thickness, nearly that of sole leather, and if spread out would make an irregular circle nearly-two feet in diameter. This coating consists of what is known as the gray matter, in which all thinking is done. It is composed of cells, myriads upon myriads of them, microscopic in size, by far the most of them merely germs of what some day may become cells, but which at present are merely material for future use. The abundance of this material is such, that the most profound thinkers never use half their possibility of brain development. The wonderful thing about the brain is that these cells are developed into maturity under the desire or the effort to use them. A few of them are half developed at birth. Such are those having to do with the instinctive and functional acts of infant life. No sooner does the child feel the pressure of the air than it begins to breathe, and no sooner does it feel a pressure upon its lips than it attempts to suck. Just in the same manner the young duck begins to swim as soon as it feels the water.

The localization of function in the brain is now definitely established. One part of it is devoted to impressions of one kind; another to those of another, and so on. This fact has been established through the observed effect of lesions in certain parts of the brain, and the losses of mental power accompanying them. From one part of the brain to another there are minute fibres, called commissural fibres, which run like telephone wires, by thousands, here and there in every direction. The supposed design of these fibres is that of conveying from one part to another intelligence of its having been affected by a sense impression. Of course, we really know nothing of the actual mechanism by which sense impressions are compared with each other, and conclusions arrived at concerning them. There is reason to think, however, that nothing like a conclusion is arrived at until after a sense impression has been reflected back and forth between several of these departments of cells, or between the different localities of a single department. Whatever the subject of knowledge, whether musical effect, information, or what not, it comes into the brain only as a report of a particular kind of impression upon a nerve or nerves of sense. It is by transactions within the brain that the individual concludes concerning any impression that it is pleasurable, or that it gives him information in any way. When the impressions reported are those of articulate speech, they must be classified into their consonant and vowel elements, these grouped into words, and these again into sentences, before the mind is able to conclude anything concerning them. Sentences, again, must be remembered, and comparisons continued through several minutes, it may be, before the individual is able to follow the conclusions to which the speaker would lead him. This which thus demonstrably takes place in speech, takes place still more in music.

The elements of a music piece are: (1) rhythm, (2) determinately selected pitches, (3) certain gradations of tone color, (4) rates of movement or pulsation, (5) variations of intensity, and (6) an articulate organization of form. Each one of these departments involves the registry of a large number of sense impressions, and their comparison with each other, before anything intelligible can be concluded concerning the piece to which they belong. In rhythm, for example, there is a comparison of the succeeding impressions with the registered record of the former, as to their frequency; these comparisons are so accurate as to enable the hearer to perceive that certain impressions are multiples of others, as to their rate of frequency. The persistence of impressions of

this class is perhaps greater than that of any other. This is shown in the fact that a motive of decided rhythm, having been several times heard already in the course of a music piece, is immediately recalled to the memory when only its rhythm is repeated, although the transformation of the melodic intervals may be so complete as to amount to an inversion. It is also seen in the fact that one not unfrequently marks time to music heard at a distance while he is engaged in something near at hand, as in conversation, for instance. It is also known that a person engaged in writing or study, occupying apparently the whole attention, can be made to whistle a familiar air, if the air be sounded very softly in his hearing. If it be sounded loudly, his attention will be consciously drawn to it, but if softly, he will not know that he has heard it, but will unconsciously whistle it or hum it, according to his habit of giving expression to the music that happens to engage his fancy. In fact the impression of time is so strong in music that the pulsation of the rhythm is the one and single element of unity between the different movements of sonatas, symphonies, etc., where there is no repetition of key, no repetition of motives out of the other parts of the work, and nothing apparently upon which an impression of unity can base itself. It was formerly supposed between the different movements of a sonata, that the unity, which all good observers felt, and which all æsthetic laws required to subsist between them, was only what they called "an ideal unity;" as if there could be an ideal unity, or any kind of unity, in our present state of existence, at least, without some physical basis through which it could impress itself upon the attending consciousness. In this case that element is the pulsation of the time. If there be another, it will come out later in the present discussion.

The most elaborate comparisons undertaken by the brain, in respect to music, are those having pitch for their subject matter. The object of all comparisons between one sense impression and another, is that of finding between them a principle of unity. It is for this purpose that the mind seeks to group vowel elements and consonant elements into words, and words into sentences, and sentences into discourse. Now in music the comparisons in respect to pitch are of the most elaborate description. We can hardly hope to take account of more than a small part of them; and in doing this we are very likely to regard comparisons as simple which in reality are highly complex. What is a melody, as we conceive it? It is, first, a succession of pitches, having an agreement of what we call tonality, as well as a definitely organized movement and motivization in time. The perception of the principle of tonal unity, involves the conception of all the tones in the key; or of so many of them as are necessary to render the key certain. We do not know how many subconscious comparisons it may need to produce this impression; but be they many or few, they must all be made before we can be certain that a particular succession of pitches is part of the same key. This latent impression of the key as a whole is present and enters into all our enjoyment of a melody; or, at least, into such an enjoyment of it as would enable a musical person to repeat it. This involves the perception or recognition of all the points of repose, as to their place in key, and of the place of every tone between them, because in this the meaning of the

It is easy to demonstrate that what we call the mental effect of tones in key rests upon a perception of the key as a whole. For instance, there is a melody called Dennis, well known to American singers. This melody is of a gentle expression; its quality is due, apparently, to the fact that out of thirteen accents five fall on "do," the tone of repose, and three on "mi," the steady or calm tone, to use the naming of the Tonic Sol-Fa. The vigorous tune Warwick, on the contrary, has seven accents on "do," one on "re," four on "mi," one on "fa," nine on "sol," four on "la," and two on "si." The strength and dignity of this melody, therefore, reside in the preponderance of sixteen accents upon those two extreme points of the major scale, "do," the tone of repose, and "sol," the strong tone. The same\_influence will be found to pervade all the slow movements of the great masters, one and all; in so far as they possess an expression residing in the key relationship of the tones themselves, it will be found to correspond with the preponderance of accent upon particular tones of the scales. It is important to observe that the coloring of tones in key belongs to them merely as tones in key. As soon as these tones are put in some other key their characteristic expression changes, as any reader can easily convince himself, by a few well-man-

aged experiments. This being the case, it follows that the expression of tones in key will not be perceived by a hearer unable to remember and compare, and refer each tone to its proper place with reference to the other tones heard in the same connection. Not only those heard in the same connection, but with those which might be heard in the same connection. For it is not necessary that all the tones of the key should actually be present; it is enough if there be sufficient to afford a well-grounded conception of the key. The mind supplies the missing links, just as it supplies missing lines in many drawings and other representations or suggestions of familiar things of the external world. Or, just as it supplies the missing elements of imperfectly articulated speech. In fact, it is not until the hearing is partly lost, that one realizes the extent to which missing links are supplied in comprehending the half-delivered discourse of indifferently educated persons.

But it is in the department of harmony that the most elaborate comparisons are entered into. There is reason to think that not only are chords heard, or felt, as we say, in connection with all melody tones of sufficient duration, but that all chords belonging to the key are conceived along with it. It is this which renders certain kinds of advanced music so difficult to many who have neither the heredity nor the habit of taking into account so many remote relations. When the harmonies are strange, and when they are not those which the educated ear would anticipate in connection with the melody tones, the ear finds itself unable to discover the underlying principle of tonal unity as to the harmony, and the music becomes unenjoyable, if not unintelligible. That far-reaching comparisons of this kind are made over much wider reaches of territory than is commonly supposed, is shown by the fact that modulations are immediately appreciated by an expert listener. No sooner has the tone of transition entered than he immediately feels the new key, both for itself independently, and as related to the old one. It is the difficulty of doing this, in certain cases of misleading digressions of key, which forms the principal obstacle to the reception of some of the music commonly known as "advanced," by which is meant that music of the modern German school, dealing largely in enharmonic changes and remote transitions. These transitions do not all of them rest upon considerations of a true tonality, but are liberties which the composer feels himself warranted in taking, his justification being derived from the tempered scale of the pianoforte and other instruments of fixed scale. To pass directly from the key of E flat, for instance, to that of D sharp, through what is called an enharmonic change, wherein the two keytones are supposed to be identical, is of the nature of what in speech is called a pun, and to many hearers it is misleading in the same way. While they are seriously comparing and coördinating the impressions within themselves, under the belief that the bond of unity in the case in hand is to be found in the tonic of E flat, the composer sweetly changes his signs, and immediately proclaims himself in the key of D sharp. This would not make a difference to the hearer, guided by his ear only, if it were not for the retinue of keys, relatives of the new ones, which the change drags after it. Still our musical theory is so inexact at present that we do not really know how far the correspondence of enharmonic keys exists in a true musical science.

The difficulty of finding the true bond of tonal unity becomes even greater when modulations by means of the diminished seventh are introduced and resolved in different ways, as they often are. To follow these requires the same kind of quick musical consciousness and indifference to considerations of strict veracity, as are needed for appreciating the play upon words which constitutes much of the so-called wit of society. The sincere person, accustomed to weigh his words, and justly to measure every part of his sentences over against that part of the truth which it is supposed to represent, finds himself left in the lurch at every step of these happy-go lucky dancers along the highway of art. To enter into this branch of the subject fully would be impossible without the aid of examples in musical notation; and for these, perhaps, the reader would not care. The question is a curious one, but the student can easily settle it for himself by analyzing any piece of Wagner's, for example, and calculating the vibration frequencies of the different tones, and of the new key tones, taking the starting point of the composer, and allowing for every change of key. He will find it very difficult to justify some of the changes, in the light of a pure music theory. A comparison of this kind undertaken some years ago concerning the modulations of a part of Wagner's "Lohengrin" yielded the following results :-

The passage analyzed was the first three lines of page 23 of the Novello edition of "Lohengrin." It commences in the key of F. At the third measure, however, where Frederick says, " Now ye shall know the name of her accomplice," the key changes to F minor. Now, taking middle C at 522 vibrations, which is about that of the so-called French diapason, and computing around to A flat major, we have an F of 687 vibrations per second. This F is supposed by Wagner to be enharmonic with the former one, or, more properly, identical with it. as, indeed, it is on a tempered instrument. In the next line he modulates into A flat, 824 vibrations. There is then a transition into C flat, in which A flat would have 814 vibrations per second. In the third measure of the same line there is a C flat having 977 vibrations per second : this is enharmonically changed to B natural, which would have 978 vibrations, and is, therefore, practically identical. In the next line there is a C sharp of 1101 vibrations, which is enharmonically changed to D flat, of 1099 vibrations, as before, practically identical. etc. In so far as these inductions prove anything, it is that Wagner's transitions are singularly near a correct perception of pure mathematical

But setting aside difficult questions of this kind, it remains incontrovertible that there is no intelligent hearing of music without comparisons of tone with tone, as to their underlying bond of unity upon the harmonic side, extending over wide reaches and involving extremely complicated coordinations of sense perceptions. It may be claimed by those intent upon simplifying this operation, that the impression of key does not rest upon any such extended induction as here represented: but that any chord is received and accepted by the ear if it be sounded long enough, or if the impression of it be not interfered with by the entrance of some other chord having possible claims to the rank of tonic. This is undoubtedly the case; but it happens that in all music this other chord always does enter; and not one alone, but many others, some of them so remote as not easily to be referred to a place in connection with the chord which the ear wished to take as its point of departure. In rejoinder to this we may be told, and told justly, that the ear accepts the chord as that of the tonic, if it hears it oftener than any other, and especially if such a chord begins and ends the passage. This gives the ear the leading of the first impression, and leaves it with the advantage of the same chord for farewell. The observation is perfectly just, and it is altogether likely that the conclusion of tonality often rests upon no more complete evidence than this. Still, evidence of this kind will not convince the ear unless the chords that intervene between the opening and the closing are compatible with the tonic suggested by the opening and closing chords. It is only necessary to consider the disturbing effect of hearing a melody in which unexpected transitions occur, to recognize the fact that however contented the ear may be to receive and rest upon its first impression as to the tonical relation of the chord or passage, it is, nevertheless, engaged in a continual series of comparisons between every chord in the series and its supposed place in the key, upon the hypothesis of this first chord being the tonic.

That this theory is just, also appears in another way, namely, by considering the manner in which the law came to be established in harmony that the tonic chord should begin and end a composition. Such a law could have had no other origin than by a sort of survival of the fittest; that is to say, through observing the fact that a certain chord in every key was more satisfactory to end with than any other chord in the same key. That the same chord was also more satisfactory as a beginning, was probably a later conclusion. The early church keys, persisting long after the discovery of harmony and the settlement of a true tonality for secular music, are evidence of the extent to which the ears of many generations were uneducated to this perception. At the present time it is extremely difficult to induce professional musicians to compose in these old tonalities, and it may be doubted whether a single composer of the present time does so purely, according to the early tradition of the allowable progressions of harmony in these keys. Modern ears have become so sensitive to harmonic progressions, and the relations which every progression implies, that they are offended by these progressions, which, to our fathers or grandfathers appeared allowable, at least for the uses of religious worship.

# PIANO TEACHING.

F. LE COUPPEY. III.

FIRST LESSONS.—SHOULD A MUSICAL EDUCATION BE BEGUN BY THE STUDY OF SOLFEGGIO?

It is believed, and it is a prejudice unfortuart is believed, and it is a prejudice unfortu-nately too widely diffused, that in laying the foundation of a musical education, an inferior teacher and a poor instrument will answer all purposes. I cannot too strongly express my disapproval of an opinion so opposed to the rules of common sease. Far from being of no consequence, the first lessons, on the contrary, exercise a very direct action on the pupil's future, and their influence is long felt. Often, several years hardly suffice to correct faults contracted during a few months, and more than one talent has gone to ruin from having been badly directed at the outset. Even if it does not lead to any such serious consequences, the use of a poor instrument causes other troubles that should be considered. If the piano is old, worn out, or out of order, there is danger that the pupil will soon be disgusted. Who would not object to playing on an instrument whose shrill and cracked tones continually grate on the ear! A good piano, then, is indispensable. The resistance of the keys, yielding more or less easily to the touch, ought to be in proportion to the strength of the fingers. The piano, moreover, should be frequently tuned, for a false instrument injures the ear and destroys the feeling of intonation. It is no doubt an advantage to unite the talent of a virtuoso to the merit of a teacher, but it is by no means indispensable for a teacher to be a skillful performer. In order to conduct a child's musical education successfully, it is sufficient to have studied under the direction of an experienced master, and, above THE KIND OF MESIC THAT SHOULD FORM THE all, to possess what is understood by these words, a good method. Let me quote here a few lines from the preface to one of my books:\*

\*A, B, C, du piano. Methode pour les commençants. "During the first few months, the study of music, properly so called, and the study of the complication of difficulties will inevitably arise; When a child's musical education drags along slowly and tediously, the reason of it must be sought for way back in the beginning. Con-sider, indeed, all that is expected of a pupil from names of the notes on the two different clefs, ing of the accidental signs, the sharps, the flats, etc., the position of the hands on the keyboard, I lay it down as a prin ing or the decounts sgas, the said ps, the mans, pearler within a rev years. The content of the hands on the keyboard, I lay it down as a principle, that piano inthe flexibility of the arms, the holding of the struction ought to be grounded on the study of
body, the regular movement of the fingers, the classical music, which lefts, if I may be allowed

feggio, and on the other, to make execution a will be still less reason to doubt. What modern

be lengthened, though it is not to be forgotton that they must never be otherwise than agreeable. He should be led, above all things, to love music will say that the works of the great mas-the study; it should be transformed into a ters present a difficulty of interpretation which the study; it should be transformed into a ters present a difficulty of interpretation which pleasure; in short, his attention should always renderes the study of them impossible to young be held in an interesting way. In beginning, pupils. I will agree on this point so far as conpupils are inspired with ardor and good will, eerns Bach, Weber and Beethoven, though the and if the teacher can keep them in this latter has written some easy music. This objectuappy mood, if he knows how to make his less-tion will entirely disappear, however, if the some attractive to them, the hour of his coming, repertory of the other composers of the last for form being desired as a time of weathers. far from being dreaded as a time of weariness, will even be awaited with eager impatience, repeat, that the child's first lessons should be short and frequent; it is also advisable that his regular practice be watched over, either by his mother, or by the one intrusted with the responsibility of his education, and this person should carry out the teacher's directions in every point, without questioning the means he employs. Unfortunately, many parents will not admit that their child is capable of understanding anything not clear to themselves, and often by their awkward objections they interfere in a lesson, and not only aunoy the teacher, but do harm to the pupil. This tendency to meddle with the privileges of the teacher cannot be too strongly condemned. Parents should assist in preference of desical action of plano study, I do not wish to reject modern him, second him, always, however, giving the example of the deference that the pupil owers to that it be studied in a small proportion, for it strongly condemned. Parents should assist the master.

IV.

BASIS OF A GOOD EDUCATION. IS CLASSICAL TO BE PREFERRED TO BRILLIANT MUSIC?

In the preceding chapter I have insisted upon the utility of keeping up the study of the sol-feggio along with that of technique, all of which has been advocated by others before me. It is muste, properly so called, and the same from one often said that right will prevail in the end, yet another. They may be carried on at the same much time is often required for truth to suctime and in some degree parallely; but if they ceed in replacing error. If famous masters have are combined in one and the same study, a vainly insisted on reforms, if the authority of the combined of the property of the combined of they have been combined in the same study. their words has been unheeded, if they have the pupil is wearied and the teacher discouraged. not been able to make their voices heard, I can scarcely hope that my opinions will meet with more attention.

Let us suppose that the pupil has overcome the first difficulties of the elementary study; at the very first lessons, think of the multitude of this point the question arises, what kind of things claiming a share of his attention, the music will be most favorable to his progress? Tapproach this question with some hope of being ought to put only good music into his pupils' listened to, for my words will be found in har-hands. This point is esseptial. In the same their value and that of the rests, the different listened to, for my words will be found in har-combinations of measure and rhythm, the mean-mony with the new tendencies which have ap-

manner of striking the key, and, in a word, all to express it, the healthiest food for students, that constitutes the theory, reading, and execution. You are led to wonder that a young and natural, preserves them from a certain ten-mind ever succeeds in wrestling successfully with dency to affectation and to exaggeration, toward so many difficulties all at one and the same time, which they too often allow themselves to be led. so many difficulties all at one and the same time, which they too often allow themselves to be led, in thus setting torth my principles for a basis of and you cannot but question if there are ever Moreover, classical make presents a neathers of a good musical education, I do not pretend to met with natures so gifted as to succeed even form, a finish of style, which help in develop-despite darwheak of a faulty method. Instead ing in pupils the feeling of time, of rhythm and I am glad, on the contrary, to pay them every of combining so many incongruous things, so of accentuation. In its relation to execution, it honor, and in the forements rank I recognize that many things that have no bond of union, it seems as if it had been expressly written for the Thalberg, Liszt, H. Herz, Stephen Heller, product is a many things that have no bond of union, it seems as if it had been expressly written for the Thalberg, Liszt, H. Herz, Stephen Heller, products the many allows will leave up the history of the extra

the one hand, to exercise the pupil in what is ing, now, the didactic side of the question to commonly understood by the study of the sole examine it from an artistic point of view, there special object. The professor, of course, will productions, indeed, should we dare to compare always be judge of the time when it will be to the masterpieces of the old school, to the Thenticable to unite these two parts of the art." sublime inspirations of Mozart, of Bach, of The first lessons given to a child should be Beethoven? The most brilliant talents of our century be examined attentively. In Haydn there are some very easy things, all of exquisite elegance and beauty, and Mozart's works also comprise easy compositions, every page of which reveals the refined passion so characteristic of this divine master.

In a less elevated order, Clementi, Dussek, Steibelt, Cramer, Hummel and Field have likewise written a host of pieces, such as sonatas, rondos, and airs with variations, which are all excellent for the study of the piano, without presenting any serious difficulties. Indeed, the resources are as abundant as varied. Any method which confines one to a single style, becomes an enemy to progress; and in express-ing my preferences for classical music as a basis gives a certain variety in the practice which will often serve to awaken a pupil's taste and judgment.

Besides, it is well to be familiar with all kinds, with all styles, and it would be absurd to reject any particular music for the sole reason that it does not bear a great master's name. To-day everybody writes for the piano, and from this mania for composing there results a surplus of mediocre music, and the teacher often has a long and difficult task in making a judicious choice for his pupil. In this situation he will act prudently in giving the preference to works signed by artists of unquestionable talent; at the same time he ought to have enough originality, enough independence of judgment to accept such productions as may seem to him good and usefnl, even if the anthor be obscure and completely unknown.

To resume: whatever be a teacher's preference for a particular kind or for a certain school, he way that a strong and healthy literary education excludes all frivolous reading, so, in a musical education, that which is mediocre should be rejected; and it should be early sought to form the pupil's taste, to elevate his thoughts, to in-

troduce him to the masterpieces of the art.

I do not wish to appear exclusive; I admire the true and the beautiful wherever it is met, whatever be the school to which it belongs; and in thus setting forth my principles for a basis of would be simpler and more logical to group purpose of giving flexibility, equality of strength many others will leave in the history of the art together the elements of the same nature; on and perfect independence to the fingers. Leavimperishable memories and justly honored names.
